Preface
D.I.R Annual 2015 – The German IVF-Registry

V. Blumenauer, U. Czeromin, K. Fiedler, C. Gnoth, L. Happel, J.-S. Krüssel, M.S. Kupka, A. Tandler-Schneider

Once again it is our great pleasure to present the 2015 annual report of the data collected by the German IVF-Registry (D.I.R). The Registry looks back onto more than 30 years of diligent data collection, extraction, and evaluation.

Since 1996, the German IVF-Registry has been electronically collecting data for each initiated treatment cycle. Meanwhile, more than 1.2 million ART cycles (ART: Assisted Reproduction Technology) have been documented in the database. The prospective documentation as well as the cycle-by-cycle data collection are of particular value and make the German IVF-Registry unique world-wide.

By August 30, 2016, 130 of the 134 centers organized in the non-profit federal association D.I.R had reported their data to the German IVF-Registry. Because of technical hurdles in the centers, three could not export their data.

97,796 cycles have been documented. A total of 57,998 women were treated in 2015, resulting in a mean of 1.7 cycles per woman. We are happy to note that despite the grave changes in reimbursement regulations in 2004, the number of treatment cycles has since been increasing steadily. For IVF and ICSI, the pregnancy rate per embryo transfer was 31.9% – a slight increase from the 31.2% in 2014. 72.7% of the pregnancies led to a birth. A birth rate of 20.5% per oocyte treatment and 23.5% per embryotransfer has been achieved. For a 25 year old woman, the probability of becoming pregnant WITHOUT any medical assistance averages at 23%. For a 35 year old woman this probability decreases to 16%, according to the [Bundesgesundheitsblatt 2013; 56: 1633–41].

These data demonstrate the high quality of reproductive medicine in Germany, leading to impressive results even under the restrictive legislation: in accordance with the "Embryo Protection Act" of 1990, the elective single embryo transfer (eSET) is still unlawful in Germany. Egg donation is forbidden as well. Cryopreservation is allowed for usually 2-PN stage oocytes only. The regulation that only a maximum of three embryos may be transferred has certainly led to positive effects. Due to the increasing quality of stimulation, improved oocyte treatment, and changes in transfer technology, the average number of transferred embryos has decreased by more than 25% in fresh cycles since 1997. By transferring no more than an average of 1.86 embryos after IVF as well as ICSI, the doctors for reproductive medicine in Germany have continued to adhere to their responsible approach towards the reduction of multiples.

To improve the documentation of pregnancy outcomes, the quality offensive initiated already for the 2014-data collection, led to a remarkable additional decrease in the lost-for-follow-up rate for 2015: 94.4% pregnancy outcomes have been documented! 62% of the exporting centers have arrived at a documentation rate of more than 95% – a remarkable result. Good and diligent documentation is proof of a highly organized and efficient workflow. The prospective cycle-by-cycle data collection is another quality feature of the German IVF-Registry, a feature that sets the German IVF-Registry apart from any other registry in the world.

The results of the comprehensive data collection in the German IVF-Registry and its reports have been cited in numerous scientific publications, nationally as well as internationally, lending support and impetus to scientific research.

Furthermore, the data have contributed to the continuous improvement of quality within the German centers for reproductive medicine. Physicians, biologists, and patients alike have benefited from the tedious work necessary to collect, export, and evaluate as well as publish the data. Therefore, we express our gratitude to all those involved:

Thank you and keep up the good work!

1) In 814 cases no IVF- or ICSI treatment was performed. 273 are cases in which oocytes were recovered but nevertheless a cryo transfer was performed
2) Reason: e.g. immature oocytes or no sperm available
3) Mean

Distribution of Indications 2015
