Preface
D·I·R Annual 2016 – The German IVF-Registry

V. Blumenauer, U. Czeromin, D. Fehr, K. Fiedler, C. Gnoth, J.-S. Krüssel, M.S. Kupka, A. Ott, A. Tandler-Schneider

Once again it is our great pleasure to present the 2016 annual report of the data collected by the German IVF-Registry (D·I·R). The Registry looks back onto more than 30 years of diligent data collection, extraction, and evaluation.

Since 1996, the German IVF-Registry has been electronically collecting data for each initiated treatment cycle. Meanwhile, more than 1.5 million ART cycles (ART: Assisted Reproduction Technology) have been documented in the database. The prospective documentation as well as the cycle-by-cycle data collection are of particular value and make the German IVF-Registry unique world-wide.

This Yearbook 2016 is more than in previous years a yearbook of change and of organizational efforts undertaken by all authors and contributors. After years of data control and reconciliation, administrational work and programming, the implementation of a new data system was carried out in the centers. The new D·I·R data record was rolled out, which meanwhile has been mapped in the established recording software. To this end, the new ARTbox® interface was activated and the new D·I·R own data acquisition software DIRproNOVA® was installed by a first group of centers. This was a major change and required huge modifications within the existing, heterogeneous IT environments of those pioneering centers. We want to express our thanks to everyone contributing to this process: the software companies, the D·I·R data management group, the D·I·R office, and particularly the associates within those centers.

In the meantime, 111 of the 134 D·I·R member centers migrated to the new system. They are already maintaining the new D·I·R data set by exporting their data to the D·I·R database using the new ARTbox®. Another 19 centers are currently in the process of conversion.

Two new records have been achieved by German reproductive medicine as documented in this yearbook: for the first time after the year 2003 which had special influences, more than 100,000 cycles were registered for 2016, and in 2015 more than 20,000 children were born.

The 2016 yearbook is based on exploitable exports from 128 centers, for which a number of 100,844 plausible cycles was documented. A total of 62,797 women were treated in 2016, resulting in a mean of 1.7 cycles per woman. We are happy to note that the pregnancy rate per transfer in fresh cycles was at 32.3%, whereas the pregnancy rate per transfer in cryo cycles was 27.0%. In the previous year, 2015, the documented birth rate per embryo transfer was 23.6% in fresh cycles and 17.2% in cryo cycles, with a still very good general pregnancy outcome documentation of 94.7%.

Remarkably, 73.2% of the pregnancies led to a birth. A birth rate of 23.6% per embryo transfer was achieved. For comparison, the probability for a 25 year old woman to become pregnant WITHOUT any medical assistance averages at 23%. For a 35 year old woman this probability decreases to 16%, according to the [Bundesgesundheitsblatt 2013; 56: 1633–41].

This year, again, particular attention was placed on the known problems of multiple pregnancies within ART cycles. In 2015, the rate of twin births was 21.5% in fresh cycles and 15.3% in cryo cycles. As this rate is still too high, we dedicated the editorial 2017 to the motto „LESS is MORE“.

The data presented in this yearbook demonstrate the high quality of reproductive medicine in Germany, leading to impressive results even under the restrictive legislation: in accordance with the “Embryo Protection Act“ of 1990, the elective single embryo transfer (eSET) is still unlawful in Germany. Egg donation is forbidden as well. Cryopreservation is allowed for usually 2-PN stage oocytes only. The regulation that only a maximum of three embryos may be transferred has certainly led to positive effects. Due to the increasing quality of stimulation, improved oocyte treatment, and changes in transfer technology, the average number of transferred embryos has decreased by more than 25% in fresh cycles since 1997. By transferring no more than an average of 1.80 embryos after IVF and 1.83 for ICSI, the doctors for reproductive medicine in Germany have continued to adhere to their responsible approach towards the reduction of multiples.

Good and diligent documentation is proof of a highly organized and efficient workflow. The prospective cycle-by-cycle data collection is another quality feature of the German IVF-Registry, a feature that sets the German IVF-Registry apart from any other registry in the world. The results of the comprehensive data collection in the German IVF-Registry and its reports have been cited in numerous scientific publications, nationally as well as internationally, lending support and impetus to scientific research.

Furthermore, the data have contributed to the continuous improvement of quality within the German centers for reproductive medicine. Physicians, biologists, and patients alike have benefited from the tedious work necessary to collect, export, and evaluate as well as publish the data. Therefore, we express our gratitude to all those involved.

Thank you and keep up the good work!
